MD SAMIUL ALAM SUMEL

Web Developer — Business Systems & Workflow Automation

Mongla, Bangladesh | sa.sumel91@gmail.com | +880 1312 312 512 | sasumel.pages.dev | github.com/samiulAsumel | linkedin.com/in/samiul-alam-sumel

PROFESSIONAL SUMMARY

Web developer specialising in business process automation, with 12+ years of hands-on experience in cargo billing, vehicle and cargo tracking, revenue reporting and operational workflows at Mongla Port Authority (Traffic Department). Turns repetitive manual and Excel processes into working business systems: three self-built web tools are used at the billing desk and in the Traffic Department. Builds with AI-assisted development (Claude Code); requirements, business rules, testing and validation stay with me. Self-directed learning through The Odin Project and Full Stack Open. Open to international and remote roles in business process automation, internal tools and web systems, operations technology, or product development.

TECHNICAL SKILLS

Domain & Port Operations: Port billing, wharf-rent / VAT / levy calculation, cargo and vehicle tracking, container tallying and statistics, C&F agent workflows, customs-related reporting

Frontend & JavaScript: HTML5 (semantic), CSS3, responsive design, JavaScript (ES6+), PWA / offline-first, Chart.js, Tailwind CSS

Building with (OpsFlow, in development): TypeScript, React, Vite, Hono, Zod, Cloudflare Workers + D1 (SQL), Vitest, GitHub Actions

Deployment & Tooling: Cloudflare Pages / Workers, Firebase Auth / Firestore, Git & GitHub (branching, PRs), Node.js test runner, Claude Code (AI-assisted development). Learning: Node.js / Express depth

Linux & Automation (self-directed): Daily Ubuntu use; Bash scripting practice (public repos on GitHub)

PROFESSIONAL EXPERIENCE

Senior Outdoor Assistant (Revenue Branch) — Traffic Department

Nov 2017 – Present

Mongla Port Authority — *Bangladesh's second-largest international seaport*

Core Port Operations

- Work through the wharfrent billing cycle — slab-wise charge computation, VAT and levy calculation, inside/outside cargo split, and final billing for active C&F agents; identified the recurring manual-calculation bottleneck and independently built and deployed portbill, now used daily by the billing desk.
- Track cargo and vehicle positions across warehouse, shed, and yard terminal locations daily; the single-person, Excel-only version of this record was the direct trigger for building carview, now the Traffic Department's shared, version-controlled tracking system.
- Operate the port automation billing system end-to-end and coordinate C&F agent documentation and advance payment planning.

Self-Initiated Web Development & Learning

- Talked to the billing desk, Traffic Department, and C&F agents to find the manual bottleneck in each workflow — then designed and deployed 3 live web applications now used daily by C&F agents and port staff, built with plain JavaScript/HTML/CSS and AI-assisted development as a productivity tool.
- Worked through a large part of a full-stack curriculum (HTML/CSS, JavaScript, React, part of Node.js/Express and Next.js) alongside a full-time port operations career, before stepping away to focus on shipping real projects.
- Maintain an active public GitHub portfolio (github.com/samiulAsumel) demonstrating continuous technical growth.

Junior Outdoor Assistant — Port & Terminal Operations

Nov 2013 – Nov 2017

Mongla Port Authority

- Assisted in port inspections, vessel operations, and cargo handling under senior supervision; monitored cargo dwell time and vehicle positioning across terminal locations.
- Built foundational expertise in wharfrent billing, maritime logistics, and customs clearance that underpins all later self-initiated digital work.

FEATURED PROJECTS

Port Billing Calculator — Live | Case study

Problem: Port billing system creates permanent entries — C&F agents had no way to estimate wharfrent charges before committing, causing billing disputes, excessive dwell time, and repeated counter visits.

Real-time advance wharfrent calculator: slab-based charge computation, VAT and levy calculation, inside/outside cargo split, hoisting charge auto-calculation, print-ready A4 output. Used at the billing counter to check charges before final submission.

Tech: JavaScript, HTML/CSS, Cloudflare Pages, PWA, Print Output

Daily Car Balance & Location Tracking System ("carview") — Case study

Problem: Vehicle positions across warehouse, shed, and yard were recorded in one person's personal Excel file — invisible to all other staff, creating bottlenecks and dependency on a single individual.

Offline-first PWA tracking 8 port locations, with Cloudflare Worker + private GitHub repo sync, a Chart.js analytics dashboard (7 charts + KPIs), 13 report sections, and Excel export. Built for Mongla Port Authority's Traffic Department.

Tech: PWA, Cloudflare Worker, Chart.js, GitHub Sync, Excel Export

OT Bill Management System — Case study

Problem: Overtime billing was a fully manual Excel process — multi-step hourly rate calculations and final bill generation done by hand every cycle.
Staff enters an employee profile once; the system generates the complete final OT bill instantly with correct hourly rate, cumulative date-wise OT calculation, and A4 print-ready output.
Tech: JavaScript, Employee DB, Auto-Calc, A4 Print, Cloudflare Pages

Client Intake Form — Live | GitHub
Problem: Collecting project requirements from a client over email or chat is unstructured — details get missed, wasting time on both sides.
Project requirement intake form — 18 structured sections, a serverless submission API, and a password-protected admin dashboard that tracks each lead from New to Won/Lost, with the client's own email app as a fallback.
Tech: JavaScript, HTML/CSS, Cloudflare Pages Functions, GitHub API

SalahSync — Live | GitHub
Problem: A static printed daily-routine sheet couldn't adapt when Fajr time or office hours shifted, and couldn't track whether a prayer was actually made in jamaah, alone, or missed.
Offline-first installable PWA: set Fajr time/location and office hours once, and the full day's schedule (Tahajjud through sleep) recalculates itself, with a prayer/amal tracker, streaks, and offline solar prayer-time calculation — no API dependency. Personal daily-use tool, bilingual Bangla/English UI.
Tech: PWA, Offline-First, Vanilla JS, i18n

World Kitchen Atlas — Live | GitHub
Problem: Most recipe content online skips real culinary history, and asserts uncertain food history as settled fact rather than acknowledging what isn't actually confirmed.
Next.js static-export culinary encyclopedia on Cloudflare Pages: continent -> country -> dish browsing, client-side search, and a per-dish confidence rating instead of presenting every entry as equally certain. Cloudflare Worker proxies a private GitHub data repo, admin CRUD, and a Durable-Object-backed visit counter. Asia live (7 countries, 295 dishes); other continents planned.
Tech: Next.js, TypeScript, Cloudflare Worker, Static Export

English Mastery — Live | GitHub
Problem: English-reading material online is usually a loose pile of pages with no level structure, so a learner can't tell where they are or what to read next.
Content-driven learning platform: 88 reading lessons across 9 skill levels with 87 paired writing tasks and speaking drills. A Node build script validates every Markdown lesson against a schema and generates the whole static site, so adding a lesson is a one-file change. Zero-framework HTML/CSS/vanilla JS output, GitHub Actions CI, auto-deployed to Cloudflare Pages.
Tech: Node.js, Vanilla JS, Static Site Generation, GitHub Actions, Cloudflare Pages

Outreach Copilot — Live | GitHub
Single-user AI-drafted cold-outreach tool — Cloudflare Pages + Workers API, D1-backed leads/analytics, Workers AI draft generation across email/LinkedIn/WhatsApp/cover letter; every send stays a manual, deliberate step.

JARVIS *(source available, no public demo)* — GitHub
Self-hosted personal AI assistant with multi-model routing (Groq, OpenRouter, Claude, Gemini, local Ollama), voice I/O, and persistent memory.

LINUX / AUTOMATION PRACTICE

Six self-directed Bash automation projects: zero-downtime deployment with auto-rollback (auto-deploy-pipeline), SSL certificate monitoring and renewal (auto-ssl-manager), log analysis and threat alerting (log-analyzer-alert), CSV-driven user/access lifecycle management (linux-user-access-mgmt), user/group provisioning and sudo policy automation (enterprise-user-mgmt), and multi-team file-sharing permissions with POSIX ACLs (secure-file-sharing). Daily Linux (Ubuntu) user; self-driven learning, not job-critical production work.

SELF-DIRECTED STUDY

The Odin Project & Full Stack Open *Aug 2026 – Present*
Self-Directed — In Progress
Self-paced study for code comprehension, not a certificate — starting from The Odin Project's Intermediate HTML and CSS course, then Full Stack Open (University of Helsinki): JavaScript fundamentals, Node.js/Express in depth, testing, and Git workflow, built from assignment briefs rather than a course guide.

EDUCATION & LANGUAGES

Higher Secondary Certificate — Business Studies: Khulna Public College, 2009 – 2011
Secondary School Certificate — Business Studies: Mongla Bandar Secondary School, 1999 – 2009
Languages: Bengali — Native | English — Professional
